

Stochastic Models and Optimization: Problem Set 1

Roger Garriga Calleja, José Fernando Moreno Gutiérrez, David Rosenfeld, Katrina Walker

March 3, 2017

Problem 4 (Path Bottleneck Problem): Consider the framework of the shortest path problem. For any path P , define the **bottleneck** arc of P as an arc that has maximum length over all arcs of P . We wish to find a path whose length of bottleneck arc is minimum, among all paths connecting the origin node to the destination node. Develop and justify an analog of the label correcting algorithm that solves this problem.

Problem 5. TSP Computational Assignment:

Visit the website: <http://www.math.uwaterloo.ca/tsp/world/countries.html>. Solve the Traveling Salesman Problem for Uruguay based on the dataset provided. You can use your favorite programming language and solution method for the TSP. Provide a printout of your code with detailed documentation, and compare the optimal solution you obtain to the one available at the website.

The code has been done in R. We used 3 heuristic approaches to find approximate the problem: The nearest neighbor, the greedy algorithm and the simulation annealing. We can see that the best approach (annealing) is above the optimal solution by 12%, however comparing to the second best it just 1% below. Furthermore, this 1% represented an important loose in terms of efficiency. In the following table you can see some important results:

	optimal	nearest neighbor	greedy	annealing
distance	79114.00	100056.45	89559.29	88985.51
distance/optimal		1.26	1.13	1.12
run time (min)		0.19	2.55	11.69
